FOREWORD

TO OWNERS, USERS, AND OPERATORS:

The safe and efficient operation of a lift truck requires skill and alertness on the part of the operator. To develop the skill required the operator must:

- Receive training, pursuant to OSHA 1910.178(1) dated 12/98, in the proper operation of THIS lift truck.
- Understand the capabilities and limitations of the lift truck.
- Become familiar with the construction of the lift truck and see that it is maintained in good condition.
- Read and understand the warnings and operating procedures in this manual.

In addition a qualified person, experienced in lift truck operation, must guide a new operator through several driving and load handling operations before the new operator attempts to operate the lift truck alone.

It is the responsibility of the employer to make sure that the operator can see, hear, and has the physical and mental ability to operate the equipment safely.

Various laws and regulations require the employer to train lift truck operators. These laws and regulations include:

- Occupational Safety and Health Act (USA)
- Canada Material Handling Regulations

NOTE: A comprehensive operator training program is available from YALE CORPORATION. For further details, contact your dealer for YALE lift trucks.

This Operating Instructions manual contains information necessary for the operation and maintenance of a basic fork lift truck. Optional equipment is sometimes installed that can change some operating characteristics described in this manual. Make sure the necessary instructions are available and understood before operating the lift truck.

Some of the components and systems described in this Operating Instructions manual will NOT be installed on
your unit. If you have a question about any item described, contact your dealer for YALE lift trucks.

Additional information that describes the safe operation and use of lift trucks is available from the following sources:

- Employment safety and health standards or regulations (Examples: "Occupational Safety and Health Standards (USA)", "Canada Material Handling Regulations".

- Publications from government safety agencies, government insurers, private insurers and private organizations (Example: Accident Prevention Manual For Industrial Operations, from the National Safety Council).

- "Guide for Users of Industrial Lift Trucks" describes lift truck safety, good maintenance practices, and training programs. Available from your dealer for YALE lift trucks.

NOTE: YALE lift trucks are not intended for use on public roads.

NOTE: The following symbols and words indicate safety information in this manual:

⚠️ WARNING
Indicates a condition that can cause death or injury!

⚠️ CAUTION
Indicates a condition that can cause injury or property damage!

The following WARNING is a label and must be on the lift truck.

**WARNING**

FAILURE TO FOLLOW THESE INSTRUCTIONS CAN CAUSE SERIOUS INJURY OR DEATH.

AUTHORIZED, TRAINED OPERATOR ONLY.

KNOW THE EQUIPMENT: KNOW operating, inspection and maintenance instructions in MANUAL. DO NOT operate or repair truck unless trained and authorized. INSPECT truck before use. Do not operate if truck needs repair. Tag truck and remove key. Repair truck before use. USE attachments for intended purpose only. MAKE SURE truck is equipped with overhead guard and load backrest adequate for the load.

LOOK WHERE YOU ARE GOING: IF YOU CAN'T SEE, DON'T GO. TRAVEL in reverse if load blocks forward vision. MAKE SURE tailswing area is clear before turning. SOUND horn at intersections or whenever vision is blocked. WATCH clearances, especially overhead.

KNOW YOUR LOADS: Handle only stable loads within specified weight and load center. See plate on this truck. DO NOT handle loose loads higher than load backrest. SPACE forks as far apart as load allows and center load between forks. Keep load against load backrest.

KNOW THE AREA: CHECK dockboard width, capacity and security. NEVER enter a trailer or railroad car unless its wheels are blocked. WATCH floor strength. FILL fuel tank or charge battery only in designated area. AVOID sparks or open flame. Provide ventilation. TURN OFF engine when fueling. DO NOT start truck if fuel is leaking. KEEP vent caps clear when charging battery. DISCONNECT battery during servicing.

USE COMMON SENSE: NEVER transport people on any part of the truck. DO NOT use truck to lift people unless there is no other practical option. Then use only a securely attached special work platform. ALLOW NO ONE under or near lift mechanism or load. DO NOT move truck if anyone is between truck and stationary object. OPERATE truck only from operator's seat. KEEP arms, legs, and head inside operator's compartment. OBEY traffic rules. Yield right-of-way to pedestrians. BE in complete control at all times. BEFORE DISMOUNTING, neutralize travel control, lower carriage, set brake. WHEN PARKING, also shut off power, close LPG fuel valve, block wheels on inclines.

PROTECT YOURSELF, FASTEN YOUR SEAT BELT: AVOID bumps, holes, loose materials, and slippery areas. AVOID sudden movements. Operate all controls smoothly. NEVER turn on, or angle across an incline. Travel slowly. TRAVEL on inclines with load uphill or unloaded with mast downhill. TILT mast slowly and smoothly. LIFT OR LOWER with mast vertical or tilted slightly back. USE minimum tilt when stacking elevated loads. TRAVEL with carriage as low as possible and tilted back. SLOW DOWN before turning—especially without load. **FAILURE to follow these instructions can cause the lift truck to tip over!** DO NOT jump off if the truck tips! HOLD steering wheel firmly. BRACE your feet. LEAN FORWARD and AWAY from the point of impact.

FIGURE 1. MODEL VIEW SHOWING MAJOR COMPONENTS (3 of 3)
GENERAL
This series of electric rider lift trucks is available in the following models:
ERC040GH, ERC050GH, ERC060GH and
ERC065GH (A908)
ERC030AH and ERC040AH (B814)
ERP040DH, ERP050DH and ERP060DH (D216)
The ERC series of lift trucks have solid rubber tires (often called cushion tires) that are pressed onto the rim.
The ERP series of lift trucks have pneumatic tires or solid rubber tires that look like pneumatic tires.
The operation of the lift truck is the same for all models. A battery supplies power for the traction motor, the hydraulic pump motor, the power steering pump motor and the control panel and instruments.
These models all use AC motor and control technology for the traction system. The hydraulic pump motor can be a DC motor controlled by a contactor, or an AC motor controlled by an AC motor controller. The steering motor is a DC brushless motor.
The electric lift trucks described in this manual have regenerative braking. This is in addition to the regular service brakes at the drive wheels. Regenerative braking allows the operator to change the direction of travel, without applying the service brakes. When a new direction of travel is selected, regenerative braking uses the motor to stop the lift truck before traveling in new direction.
A brake pedal actuates the hydraulic service brakes at the drive wheels. A foot operated parking brake also actuates the same brakes. Some lift trucks have additional linkage that actuates a parking brake on the drive shaft of the traction motor. This extra parking brake is actuated when the operator leaves the seat.
Forward or reverse movement can be controlled by a direction control lever mounted on the steering column or by a Foot Directional Control pedal. When a direction control lever is installed, the lift truck has an accelerator pedal for speed control. If the lift truck has a Foot Directional Control pedal, the pedal controls both direction and speed.
The ERC040–065GH lift trucks can be equipped with either standard manual hydraulic levers (see FIGURE 4.) or Electro-Hydraulic (E-Hydraulic) levers which consists of either mini-levers or a joystick (see FIGURE 5.).
All lift trucks are equipped with a battery discharge indicator and an hourmeter. The bar graph type of battery discharge indicator shows the state-of-charge of the battery. The system also has a "lift interrupt" function, which prevents the operator from lifting loads, when battery power is low, and saves enough battery power for operator to move lift truck to a battery recharger. These lift trucks have a "light emitting diode" (red LED) display panel as indicators and a "liquid crystal display" (LCD) screen. The LCD screen shows the battery bar graph and gives other service information. Hourmeter operating time(s) are shown on the (LCD) screen.

OPERATOR PROTECTION EQUIPMENT

The OVERHEAD GUARD (see FIGURE 1.) is intended to offer reasonable protection to the operator from falling objects, but cannot protect against every possible impact. Therefore, it must not be considered a substitute for good judgment and care when handling loads. Do not remove the overhead guard.

The BATTERY RESTRAINT is designed to hold the battery within the battery compartment if a tipover occurs. The ERP040-060DH series of lift trucks have a restraint rod fastened to the bulkhead of the battery compartment. The assembly for the hydraulic control levers holds the hood in the closed position. The hood can be raised for battery access. Gas springs help raise and hold the hood in the up position. A lever fastened to the restraint rod will retract the restraint rod for battery removal and prevent closing the hood if the restraint rod is not correctly engaged.

The ERC030-040AH and ERC040-ERC065GH series lift trucks have a steel plate (hood frame) under the hood that is connected to the truck frame with hinges. A gas spring helps raise the hood. A stop rod holds the hood in the up position. A latch locks the hood assembly in the down position.

The battery restraint system must function so that the operator restraint system can operate correctly. Operation of the battery restraint system requires that the maximum movement allowed for the battery is 13 mm (0.5 in.) in any horizontal direction. This will reduce the risk of operator injury in a truck tipover. An adjustable battery spacer plate prevents the front-to-back movement of the battery. Batteries for this series of lift trucks must all have the same length dimension to just fit the battery compartment width. For correct battery sizes, see the BATTERY SPECIFICATIONS at the rear of this manual.
The SEAT BELT and HIP RESTRAINT BRACKETS provide additional means to help the operator keep the head and torso substantially within the confines of the truck frame and operator compartment if a tipover occurs. This restraint system is intended to reduce the risk of the head and torso being trapped between the lift truck and the ground, but it can not protect the operator against all possible injury in a tipover. The hip restraint bracket will help the operator resist side movement if the seat belt is not fastened. It is not a substitute for the seat belt. Always fasten the seat belt.

The LOAD BACKREST EXTENSION is installed to keep loose parts of the load from falling back toward the operator. It must be high enough, with openings small enough to prevent the parts of the load from falling backwards. If a load backrest extension that is different from the one installed on your truck is required, contact your dealer for YALE lift trucks.

FIGURE 2. NAMEPLATE AND LABEL
NAMEPLATE

WARNING

Any change to the lift truck, the tires or its equipment can change the lifting capacity. If the Nameplate does not show the maximum capacity, or if the lift truck equipment, including the battery for electric trucks, does not match that shown on the Nameplate, the lift truck must not be operated.

The capacity is specified in kilograms (kg) and pounds (lb). The capacity is the maximum load that the lift truck can handle for the load condition shown on the Nameplate.

The maximum capacity for the lift truck, at full load height, must be shown on the Nameplate. Special capacities with the load height reduced or with optional load centers, may also be shown on the Nameplate.

The lift truck serial number code is on the Nameplate. The serial number code is also stamped on the right side of the rear bulkhead (battery compartment) on the top edge or on the front face near the top.

When a lift truck is shipped incomplete from the factory, the Nameplate is covered by the label shown in FIGURE 2. If your lift truck has this type of label, do not operate the lift truck. Contact your dealer for YALE lift trucks to obtain a complete Nameplate.

SAFETY LABELS

Safety labels are installed on the lift truck to give information about possible hazards. It is important that all safety labels are installed on the lift truck and can be read. See FIGURE 3.

⚠️ **WARNING**

The hood and battery restraint, with its latch mechanisms, must operate correctly before the lift truck is operated.

The battery restraint and hood frame is a steel weldment that has a hinge at the front of the battery compartment. Use the latch handle at the rear of the hood to release the hood frame and battery restraint. Raise the latch handle and slide the handle toward the right side of the truck. A spring moves the handle back to the left. A gas spring and stop rod will hold the assembly in the **UP** position. Release the stop rod by moving it to the right before lowering the hood.

DISPLAY PANEL FEATURES

There are two dash display options, Standard and Premium. Both displays look identical. The only difference is in the display software and the resulting functionality as described below:

PREMIUM DISPLAY PANEL

- Allows pre-assigned user passwords to control driver access to the vehicle
- Provides 4 driving Modes that are accessed through the key pad

DISPLAY PANEL FEATURES

The following features are common to both the Standard and Premium Display Panels: See FIGURE 7.

- LED (Light Emitting Diode) symbol indicators

- LCD (Liquid Crystal Display) screen
- Battery Discharge Indicator (BDI) (with lift interrupt when enabled)
- Service Reminder (if enabled)
- Status Codes
- STAR push button
- Hourmeter of traction and lift pump times
- Numeric push button keys
- Allow pre-assigned service passwords to control access to Service Functions available through the dash display
- Provide a set of Service Functions which are accessed through the Mode buttons and LCD screen
FIGURE 7. FEATURES OF THE STANDARD AND PREMIUM DISPLAY PANELS.
The symbol indicators are shown and described in TABLE 3.

DESCRIPTIONS OF COMMON FEATURES

LED Symbol Indicators

The LED symbol indicators are bright red and indicate the function that is shown on the LCD screen. Some of them are also used as a visual warning of a potential problem that needs action from the operator.

LCD Screen

The LCD screen shows operator messages for the different functions. The display panel can show a maximum of 20 numbers or letters (including spaces) on each of two lines.

Battery Discharge Indicator (BDI)

The Battery Discharge Indicator (BDI) uses a bar graph as a "fuel" gauge for the Battery State-of-Charge. As the battery discharges, the bar gets shorter to show less "fuel". The green band near the bar shows the normal operating range for the battery. The yellow band is the area that the battery can still be operated in without damage. This band is yellow to indicate that the battery is nearing the point of discharge where it can be damaged with continued hard use. The red band indicates the discharge condition where battery damage can occur. Charge the battery very soon to prevent battery damage. When the battery is discharged to approximately 75%, segments 1 and 2 alternately flash on and off, and the Battery symbol flashes. Continued operation will cause lift-interrupt (if enabled) to occur to help prevent battery damage. Lift-interrupt prevents the operator from lifting loads and saves enough battery power for operator to move lift truck to a battery recharger. At lift-interrupt, there are no segments (bars) displayed, and the Battery symbol is flashing.

Service Reminder

The Service Reminder feature (if enabled) lets the operator know when it is time for periodic maintenance. A status code of 99 will show on the LCD screen and the Wrench symbol will be flashing. If maintenance is not done within 20 more hours of operating time, lift truck performance will be reduced until maintenance is completed. Have the maintenance done by authorized maintenance personnel. The service personnel must also
set the memory for the next maintenance time to allow normal operation again.

Status Codes

Status Codes give an indication to the operator that a possible malfunction or incorrect truck use has occurred. Status Codes are code numbers for a symptom or malfunction. The Wrench symbol will flash and the status code number will be shown on the LCD screen if an incorrect truck use or malfunction occurs during operation. Have authorized service personnel check and repair the lift truck if a status code number appears. The symptoms for each status code are shown in the service manual AC MOTOR CONTROLLERS 2200 YRM 1056.

Hourmeter

The Hourmeter shows the operating time in traction hours and pump hours on the the LCD screen as a five digit number. The display is shown for four seconds after the lift truck has been operating and the key is moved to the OFF position. Traction hours are the time that the key has been in the ON position with the operator in the seat. The operating time for the hydraulic pump motor (with illuminated Hourmeter symbol) will also be displayed as a five digit number for four seconds following the traction hours.

The word TRACTION HOURS will be displayed on the LCD screen when the traction motor hours are shown. The word PUMP HOURS will be displayed on the LCD screen when the pump motor hours are shown.

DESCRIPTIONS OF ADDITIONAL FEATURES (AVAILABLE WITH THE PREMIUM DISPLAY)

The additional features of the premium display panel are described below and shown in FIGURE 7. Also see TABLE 4.

NOTE: In the following descriptions, words shown in all capital letters represent what is displayed on the LCD screen.

LCD Screen

The LCD Screen shows the information for the additional features as follows:

- User password request (if enabled)
- Operator Check List (if enabled)
The Premium display panel can show a maximum of 20 letters or numbers (including spaces) on each of two lines.

Operator Passwords

The Operator Passwords are a series of five numbers. Each of the five number digits can be the numbers 1 through 5. If enabled, the password number series must be entered into the memory by a technician and assigned to an operator. For security, the password numbers are not displayed when entered. Remember the password. A technician can use a personal computer (PC), connected to the vehicle, to check as well as assign the passwords.

NOTE: The display does not always respond immediately for every push button entry. The push button can also "click" without an actual change occurring. Make sure to watch LCD screen and wait for response before requesting another action.

After the key is moved to the ON position, the LCD screen will show ENTER PASSWORD, if this function is enabled. Use the numbered push buttons to enter your five digit password. A STAR symbol will be shown for each digit. The password can be entered as many times as needed. If the password is entered incorrectly, the message PASSWORD ERROR will appear and the operator will again be prompted to ENTER PASSWORD.

Daily Check List and Service Items

A list of items for Daily Checks And Service will be shown on the LCD screen (if enabled) after the password is accepted. The Check List has items the operator needs to check before the lift truck can be operated. Press button #1 for YES and #4 for NO after each item in Check List. These YES answers indicate that the operator says the check or maintenance has been done. The screen will show SERVICE REQUIRED for a NO answer and the lift truck will only operate in "MODE #1". This operating mode will continue until a service person performs the required service and "clears" the message. Additional Check List items will not appear until after service is complete.

Performance Modes

Four different Performance Modes of operation can be selected. Each mode can change acceleration and top speed. The factory settings increase operating speeds from slowest 1 to fastest 4. After the message MODE #X is on the LCD screen, you can change modes. The mode
MODEL DESCRIPTION

number that was last activated will appear. If you want to change the mode, push the number push button 1, 2, 3, or 4 to select a new mode. The screen will show REQUESTING MODE # Y (Y is the new mode number just entered). The message will then show MODE # Y unless this mode is not permitted under your password. The lift truck will now operate within the parameters set for that mode number until you change the operating mode number again.

Status Code Lists

The Status Code Lists is a stored history list of selected status codes for malfunctions or incorrect truck use that have occurred since the list was last cleared of entries by a technician. A total of 16 status codes can be stored on the list. When the 17th status code is stored onto the list, the first stored status code will be removed from the list. These selected status codes are NOT of malfunctions or symptoms that are currently present, but those that have occurred in the past. The lists can only be read with the key in the OFF position.

To access the status code history, wait until after the traction and pump hours have been displayed, then push the STAR push button. All of the status codes in the list will now be shown in sequence. After the last status code, END FAULT CODE HISTORY will be shown.

NORMAL SEQUENCE OF OPERATION - STANDARD DISPLAY PANEL

Following is the normal sequence that occurs after the operator is on the seat with the battery connected:

- After the key is moved to the ON position, all 40 segments of the LCD screen will be displayed as solid bars and the red indicator symbols will light up from left to right. The Seat Belt symbol will be on for an additional 10 seconds.

- The bar graph for battery-state-of-charge is on LCD screen. If the battery is discharged to lift-interrupt, the battery indicator symbol will also be flashing. If a battery of the wrong voltage has been installed, the Wrench light symbol will also be flashing. If necessary, have these problems corrected before attempting operation.

44

Turn the key to the OFF position. The following display sequence will occur:
- Display shows the hourmeter hours for the traction motor and the words TRACTION HOURS for four seconds.
- Display shows the hourmeter hours for the hydraulic pump motor and the words PUMP HOURS for an additional four seconds.

NORMAL SEQUENCE OF OPERATION - PREMIUM DISPLAY PANEL

Following is the normal sequence that occurs after the operator is on the seat with the battery connected:

- After the key is moved to the ON position, ENTER PASSWORD will be on the LCD screen if this function is enabled.
- After password is correctly entered, or if it is disabled, the first item of the Check List will be on the LCD screen if this function is enabled.
- After Check List is complete, or if it is disabled, all 40 segments of the LCD screen will be displayed as solid bars and the red indicator symbols will light up from left to right. Seat Belt symbol will be on for an additional 10 seconds.
- The last Performance Mode operation will be on the LCD screen as MODE # ___. The bar graph for battery-state-of-charge is also on LCD screen. If the battery is discharged to lift-interrupt, the battery indicator symbol will also be flashing. If a battery of the wrong voltage has been installed, the Wrench symbol will also be flashing. If necessary, correct these problems before attempting normal operation.

Turn the key to the OFF position. The following display sequence will occur:

- Display shows the hourmeter hours for the traction motor and the words TRACTION HOURS for four seconds.
- Display shows the hourmeter hours for the hydraulic pump motor and the words PUMP HOURS for an additional four seconds.

OPERATING PROCEDURES

GENERAL

Know Your Lift Truck

The forklift truck is designed to pick up and move materials. The basic lift truck has a lift mechanism and forks on the front to engage the load. The lift mechanism lifts the load so that it can be moved and stacked.

In order to understand how the forklift truck can pick up a load, you must first know some basic things about the lift truck.

The lift truck is based on the principle of two weights balanced on opposite sides of a pivot (fulcrum). This is the same principle used for a see-saw. In order for this principle to work for a lift truck, the load on the forks must be balanced by the weight of the lift truck. The location of the center of gravity of both the truck and the load is also a factor.

This basic principle is used for picking up a load. The ability of the lift truck to handle a load is discussed in terms of center of gravity and both forward and side stability.

Stability And Center Of Gravity

The center of gravity (CG) of any object is the single point about which the object is balanced in all directions.

Every object has a CG. When the lift truck picks up a load, the truck and load have a new combined CG.
The stability of the lift truck is determined by the location of its CG, or if the truck is loaded, the combined CG.

The lift truck has moving parts and therefore has a CG that moves. The CG moves forward and back as the mast is tilted forward and back. The CG moves up and down as the mast moves up and down.

The center of gravity, and therefore the stability, of the loaded lift truck is affected by a number of factors, such as size, weight, shape, and position of the load; the height to which the load is raised; the amount of forward and backward tilt; tire pressure; and the dynamic forces created when the truck is moving. These dynamic forces are caused by things like acceleration, braking, turning, and operating on uneven surfaces or on an incline. These factors must be considered when travelling with an unloaded truck, as well, because an unloaded truck will tip over to the side easier than a loaded truck with its load in the lowered position.

In order for the lift truck to be stable (not tip over forward or to the side) the CG must stay within the area of the lift truck represented by a triangle drawn between the drive axle and the pivot of the steering axle.
If the CG moves forward of the drive axle, the lift truck will tip forward. If the CG moves outside of the line represented by the lines drawn between the drive wheels and the steering axle pivot, the lift truck will tip to that side.

**Capacity (Weight And Load Center)**

The capacity of the lift truck is shown on the Nameplate. The capacity is listed in terms of weight and load center.

The weight is specified in kilograms and pounds. The load center is specified in millimeters and inches. The capacity is the maximum load that the lift truck can handle for the load condition shown on the Nameplate.

The load center of a load is determined by the location of its center of gravity. The load center is measured from the front face of the forks, or the load face of an attachment, to the center of gravity of the load. Both the vertical and horizontal load centers are specified on the Nameplate.

Loads should be transported while centered on the centerline of the lift truck. The operator must know whether or not a load is within the maximum capacity of the lift truck before the load is handled.

**INSPECTION BEFORE OPERATION**

⚠️ **WARNING**

Report damage or faulty operation immediately. Do not operate a damaged or defective lift truck. A lift truck will only do its job when it is in proper working order. If repairs are required, install a tag in the operator's area stating "DO NOT OPERATE" and remove the key from the key switch.

✅ **Checks With The Key Switch OFF**

Inspect the lift truck before use and every eight hours or daily as described in the MAINTENANCE section of this OPERATING MANUAL.

Before using the lift truck, make the following checks:

- Oil level in the hydraulic tank.
- Electrolyte level and specific gravity of the battery are correct.
OPERATING PROCEDURES

- Battery weight is within the range of battery weights on the Nameplate.
- Battery restraint mechanism operates correctly and is latched.
- The spacer plate is adjusted to limit forward, backward or side to side battery movement.
- Condition of forks, carriage, chains, mast and overhead guard.
- Leaks from the hydraulic system.
- Condition of wheels and tires.
- Seat belt fastens correctly.
- Seat is securely fastened to the seat plate or hood.

Mounting and Dismounting

⚠️ WARNING

To avoid serious injury when entering or exiting the lift truck, ALWAYS USE 3 POINTS OF CONTACT. Maintain contact simultaneously with two hands and one foot or with two feet and one hand while climbing on or off the lift truck.

Place feet carefully. Always face the lift truck when climbing on or off. Use added care when surfaces are slippery. Keep hands free of any obstacles such as food, beverages, or tools.

How To Check The SRO Circuit

NOTE: On ERP040-060DH trucks, pull the battery disconnect switch up, and on the ERC030-040AH and ERC040-065GH trucks, connect both halves of the battery connector, before preceding with start sequence below.

The lift truck is equipped with a "Static Return to OFF" (SRO) circuit that prevents travel of the lift truck if the starting sequence is not correct. The function of the SRO circuit is to make sure the operator is in the correct position to operate the controls before the lift truck will operate. The starting sequence:

1. Sit on the seat to close seat switch, and turn the key to the ON position.
2. Select the direction of travel and push the accelerator or push the Foot Directional Control pedal.
If step 2 is done before step 1 and the lift truck moves, the SRO function is not operating correctly. The sequence within step 1 is not important. The lift truck must not be operated if the SRO circuit does not function correctly. If the SRO circuit does not operate correctly, have the Master Controller checked by authorized service personnel.

When you want the lift truck to travel in the Forward or Reverse direction:

1. Make sure a charged battery of the correct voltage is installed and connected
2. Sit on the seat to close seat switch and turn key to the ON position.
3. Release the parking brake
4. Select the direction of travel using the Foot Directional Control pedal or the optional direction control lever

5. Push the Foot Directional Control or accelerator pedal for acceleration.

---

**Checks With The Key Switch ON**

Do not start nor operate the lift truck, including any of its functions or attachments, from any place other than the designated operator's position.

The operator must be aware that the lift truck can tip over. There is a great risk that the operator or someone else can be killed or injured if trapped or hit by the truck as it
tips over. The risk of injury can be reduced if the operator stays on the truck. If the truck tips over do not jump off.

**WARNING**

**FASTEN SEAT BELT**

If Lift Truck Tips Over
- Do Not Jump - Stay On Truck
- Hold Firmly To Steering Wheel - Brace Feet - Lean Forward And Away From Impact

The seat belt is installed to help the operator stay on the truck if the lift truck tips over. IT CAN ONLY HELP IF IT IS FASTENED.

THE SEAT BELT AND HIP RESTRAINT BRACKET provides a means to help the operator keep the head and torso substantially within the confines of the truck frame and overhead guard if a tipover occurs. This protection system is intended to reduce the risk of the head and torso being trapped between the truck and the ground, but it can not protect the operator against all possible injury in a tipover.

Make sure that the area around the lift truck is clear before making any operational checks. Be careful when making the checks. If the lift truck is stationary during a check, apply the parking brake and make sure the direction control is in **NEUTRAL**. Proceed carefully.

Check the operation of the following functions as described in the MAINTENANCE section:

- Check the operation of the horn, gauges and indicator lights.
- Operate the LIFT, TILT, and auxiliary functions to check for correct operation of the mast, carriage and attachments.
- Check the operation of the steering system.
- Check the operation of the Foot Directional Control pedal or the optional direction control lever and accelerator pedal.
- Check the operation of the service brakes and parking brake.
- Hood is securely latched.
OPERATING TECHNIQUES

WARNING
Before operating the lift truck FASTEN YOUR SEAT BELT.

There are a number of operations, if not performed carefully, that can cause the lift truck to tip. If you have not read the WARNING page in the front of this Operating Manual, do so NOW. As you study the following information about how to properly operate a lift truck, remember the WARNINGS.

NOTE: Lift trucks manufactured before November 1, 2005 are equipped with the Automatic Locking Retractor (ALR) type seat belts. The seat belt must fasten securely. Make sure the seat belt extends and retracts smoothly and is not frayed or torn. If the seat belt is damaged or does not operate properly, it must be replaced.

NOTE: Lift trucks manufactured after November 1, 2005 are equipped with the Emergency Locking Retractor (ELR) style seat belt. When the ELR seat belt is properly buckled across the operator, the belt will permit slight operator repositioning without activating the locking mechanism. If the truck tips, travels off a dock, or comes to a sudden stop, the locking mechanism will be activated and hold the operator's lower torso in the seat.

Basic Operating Procedures

Many people make the mistake of thinking that operating a lift truck is the same as driving an automobile. This is not true. It is true that some lift truck operating procedures are as simple and obvious as driving the family automobile. (e.g. Look where you are going, start and stop smoothly, etc.) But a lift truck is a special machine designed to do a much different job than an automobile. Because of the close areas in which a lift truck operates and its other operating characteristics (like rear wheel steering and tail swing), every operator must receive additional training, even if they have a license to drive an automobile.
The following discussion lists basic procedures applicable to lift truck operation.

1. AUTHORIZED AND TRAINED OPERATOR ONLY. This means the operator must be trained to drive the lift truck and it means that the operator must thoroughly understand the procedures for lift truck operation. It also means that a qualified person experienced in lift truck operation must guide the operator through several driving and load handling operations before the operator attempts to operate the lift truck alone. A basic education in proper driving and load handling techniques is absolutely necessary to prepare the new operator for proper defensive driving and to expect the unexpected.

2. Operate the lift truck only in areas that have been approved for lift truck operation. Certain areas contain hazardous flammable gases, liquid, dust, fibers or other materials. Lift trucks that are operated in these areas must have special fire safety approval. These areas must be designated to show the type of lift truck approval required for operation in the area. Changes to special equipment or poor maintenance can make the lift truck lose its special approval.

3. NO RIDERS. A lift truck is built for only one person -- the operator. It is dangerous for anyone to ride on the forks or anywhere else on the lift truck.
OPERATING PROCEDURES

WARNING
This lift truck is designed for handling materials. A lift truck is not designed to lift people. Do not use a lift truck to lift people unless it has been determined that there is no other practical option (scaffolds, elevated work platforms, aerial baskets, etc.) to perform the needed work.

If a lift truck is used to elevate a worker, a safety platform must be attached to the forks and carriage. The platform must be specially built to meet or exceed the requirements of ITSDF B56.1. It must have a solid floor with a surface to prevent the feet of the worker from slipping, hand rail, toe board and a screen or shield at least 7 feet high between the people on the platform and the lift mechanism.

Before anyone is allowed in the platform, lift and lower the mast slowly with the platform in place to make sure the mast functions properly. Apply the parking brake. Do not travel with people in the platform. The operator must remain at the controls. Watch for overhead obstructions.

4. Do not drive a lift truck into a elevator unless authorized to do so. Approach the elevator slowly. After the elevator is properly levelled, the lift truck must be centered so that the elevator is balanced.

When the lift truck is in the proper position in the elevator, set the brakes, put the controls in NEUTRAL, and shut off the power. It is advisable that all other personnel leave the elevator before the lift truck enters or leaves.
5. Drive carefully, observe traffic rules and be in full control of the lift truck at all times. Be completely familiar with all the driving and load handling techniques described in this operating manual.

Driving And Direction Changes

These lift trucks can have either a Foot Directional Control pedal or a direction control lever. If the lift truck has a Foot Directional Control pedal, push on the left side of the pedal to go **FORWARD**, or the right side of the pedal to go in **REVERSE**. If the lift truck has a direction control lever, move the lever toward the front of the lift truck to go **FORWARD** and toward the rear of the lift truck to go in **REVERSE**.

![FOOT DIRECTIONAL CONTROL PEDAL](image)
![ACCELERATOR PEDAL](image)

**WARNING**
DO NOT select the travel direction if the accelerator is depressed. The lift truck will move rapidly and can cause damage or injury.

To move the lift truck, select a direction, release the parking brake and push down on the accelerator pedal.

If the lift truck is equipped with a Foot Directional Control pedal, place foot on the service brake pedal and release the parking brake. Select the direction of travel by slowly depressing on either the left or right side of the Foot Directional Control pedal. Continue pressing the Foot Directional Control pedal to move the lift truck in the selected direction.

**CAUTION**
Changing the direction of travel to reverse when the lift truck is traveling fast can cause the load can come off the forks.

The operator can change the direction of travel while the lift truck is moving by moving the foot to the other side of the Foot Directional Control pedal, or by moving the direction control lever for travel in the opposite direction. This
action uses the motor for braking and can take place at any travel speed.

The lift truck will come to a stop and then accelerate in the opposite direction, unless the Foot Directional Control pedal or accelerator pedal is released. The braking action of the motor can be used to stop the lift truck. To stop the lift truck quickly, use the service brakes.

**Steering (Turning)**

Most operators can understand the need to be careful when handling loads. But some operators do not realize that a tipover can occur with an empty lift truck because similar dynamic forces are present. In fact, the lift truck will actually tip over easier when empty, than when loaded with the load lowered. Rearward tilt, off-center loads and uneven ground will aggravate these conditions.

---

**WARNING**

TRAVEL SLOWLY WHEN TURNING. Lift trucks can tip over even at very slow speeds. The combination of speed and the sharpness of a turn can cause a tipover. A lift truck is less stable when the forks are elevated, with or without a load.

IF THE LIFT TRUCK TIPS OVER, DO NOT JUMP OFF! HOLD FIRMLY TO STEERING WHEEL, BRACE YOUR FEET, AND LEAN FORWARD AND AWAY FROM THE POINT OF IMPACT.

Because lift trucks are designed to work in a relatively small space, they can turn sharper than some other vehicles. Most lift trucks are steered by the rear wheels and the rear of the lift truck can move to the side very fast during a turn. This movement is called "tail swing". An operator must be aware of tail swing and always check to make sure the tail swing area is clear before turning.
OPERATING PROCEDURES

WARNING
Failure to observe the tail swing area when making a turn can injure or kill someone.

Do not turn on an incline. To reduce the possibility of a tipover, a lift truck must not be driven across an incline.

When possible, keep both hands on the steering wheel. During most loading or unloading operations, the operator steers with the left hand. The right hand is used to operate the lift, tilt, and attachment controls.

When turning the lift truck from a wide aisle into a narrow aisle, start the turn as close to the opposite stock pile as tail swing will permit. This action permits the lift truck to enter the narrow aisle going straight ahead.

Load Handling, General
1. The capacity is the maximum load that the lift truck can handle for the load condition shown on the Nameplate. The operator must know whether or not a load is within the maximum capacity of the lift truck before the load is handled.

However, such factors as weak floors, uneven terrain, special load handling attachments or loads having a high
center of gravity can mean that the safe working load is less than the rated capacity. When such conditions exist, the operator must reduce the load so that the lift truck will remain stable.

2. Handle only stable loads. A load can have unstable items that can easily shift and fall on someone.

**WARNING**
Do not handle a load if any loose part of it is above the load backrest or any part of the load is likely to fall.

3. Position each fork the same distance from the center of the carriage. This action will help center the load on the carriage. Set the forks as far apart as possible for maximum support of the load. Center the weight of the load between the forks.

If the weight of the load is not centered between the forks, the load can fall from the forks when you turn a corner or hit a bump. An off-center load will increase the possibility of the truck tipping over to the side.

Make sure the pins that keep the forks in position are engaged so that the forks cannot move.

4. Check the condition of the driving surface. Make sure the floor will support the weight of the lift truck and the load.

**Load Handling, Lifting, Lowering And Tilting**

**NOTE:** Manual hydraulic levers are standard on the ERC040-065GH models of trucks covered in this manual. Two optional features are available to control the hydraulic functions: electronic hydraulic mini-levers (see
OPERATING PROCEDURES

FIGURE 5, and TABLE 1.) or a joystick (see FIGURE 6, and TABLE 2.).

The LIFT and TILT functions are controlled by separate levers or by moving the joystick in different directions. See the OPERATOR CONTROLS section in the Model Description section for the correct operation.

The speed of the hydraulic functions is controlled by the position of the control levers. The farther the hand lever is moved from the NEUTRAL position, the faster the speed of the hydraulic function.

Do not lift or hit anything that can fall on the operator or a bystander. Remember, a lift truck equipped with a YALE overhead guard and load backrest extension provides reasonable protection to the operator from falling objects, but can not protect against every possible impact.

A lift truck without an overhead guard provides no such protection and other personnel have no overhead protection. Avoid hitting objects such as stacked material that could become dislodged and fall.

The operator must exercise care while working near such objects. Whether the lift truck is loaded or empty, do not travel with the load or carriage in a raised position.
WARNING
Keep yourself and all others clear of the lift mechanism. Never allow anyone under or on the forks.

WARNING
NEVER put hands, arms, head or legs through the mast or near the carriage or lift chains. This warning applies not only to the operator but also a helper. A helper must not be near the load or lift mechanism while the operator is attempting to handle a load. The lift mechanism has moving parts with close clearances that can cause serious injury.

Lift and lower with the mast vertical or tilted slightly backward from vertical. Tilt elevated loads forward only when directly over the unloading place. If the lift mechanism is raised to pick up or deposit a load, keep the tilt angle in either direction to a minimum. Backward and forward tilt are helpful, but they affect side and forward stability. Do not tilt in either direction more than necessary when handling a load that is raised. The lift truck can tip forward if the mast is tilted forward with a load in the raised position.
OPERATING PROCEDURES

**WARNING**

The lift truck can tip over forward when the load is raised. Forward tipping is even more likely when tilting forward, braking when travelling forward or accelerating in reverse.

IF THE LIFT TRUCK TIPS OVER, DO NOT JUMP OFF! HOLD FIRMLY TO STEERING WHEEL, BRACE YOUR FEET, AND LEAN AWAY FROM POINT OF IMPACT.

Load Handling,
How To Engage And Disengage A Load

1. Avoid fast starts. Sudden movement can cause the lift truck to tip. People can be hurt or killed and material can be damaged.

Approach the load carefully. Make sure that the truck is perpendicular to the load. Raise the forks to the proper height for engaging the load.

2. Move forward slowly until the forks are in position under the load. The forks must support at least two-thirds (2/3) of the length of the load.

Make sure that the load is centered between the forks. Make sure that the forks do not extend past the load so that loads or equipment that are behind the load being lifted are not damaged. Lift the load a small distance from
the floor to make sure the lift truck has the capacity to lift the load.

Be Careful of Forks Beyond the Load

If the forks are longer than the load, move the forks under the load so that the tips of the forks do not extend beyond the load. Lift the load from the surface. Move backward a few inches, then lower the load onto the surface and inch forward to engage the load against the carriage. Tilt the mast backward just far enough to lift the load from the surface.

3. When a load is put on the floor, tilt the mast forward to a vertical position and lower the load. Tilt the mast forward to permit smooth removal of the forks. Carefully move the lift truck backward to remove the forks from under the load.

4. If the load is being removed from a stack, slowly move the lift truck away from the stack. When the load is clear of the stack, lower the load for travelling. Always travel with the load as low as possible and tilted backward. Lowering speed is controlled by the position of the control lever. Lower slowly and smoothly. Slowly return the control lever to the neutral position so that the load is not dropped.
or that the lift truck is not tipped over due to the rapid stop of the load.

5. To put the load on a stack, align the lift truck with the stack. Lift the load to eye level and then tilt the load forward until it is level. Raise the load higher than the point where it will be placed. Do not raise the load to a point below where the load is to be placed and "jog" the load up into position. This operation uses added energy, particularly with an electric lift truck. Be careful not to damage or move adjacent loads.

⚠️ WARNING

Move carefully and smoothly when the load is raised over a stack. When the load is elevated the center of gravity of the lift truck and the load is much higher. The lift truck can tip over when the load is raised.

IF THE LIFT TRUCK TIPS OVER EITHER TO THE SIDE OR FORWARD, DO NOT JUMP OFF! HOLD FIRMLY TO STEERING WHEEL, BRACE YOUR FEET, AND LEAN FORWARD AND AWAY FROM THE POINT OF IMPACT.

Move forward slowly. When the load is in position, lower the load on to the stack or the rack. Lower the forks just enough to remove them from under the load. Do not lower the forks so that they will drag on the surface under the load. Carefully move the lift truck backward to remove the
forks from under the load. Lower the forks when travelling.

6. When lifting round objects, use a block behind the object. Tilt the mast forward so that the forks can slide along the floor under the object to be lifted. Tilt the mast fully backward to help keep the load on the forks.

NOTE: Not every load can be lifted using only the forks of a lift truck. Some loads will require a special attachment.

**Load Handling, Travelling**

1. When travelling with the load lowered, keep the load against the carriage and the mast tilted fully backward. This action will help keep the load on the forks and give good forward and side stability.

2. Travel with the lift mechanism raised only enough to clear the ground or obstacles.

When the mast, carriage or load is in a raised position the stability of the lift truck is reduced. This stability is also critical when the lift truck is not carrying a load. The ability
of the lift truck to resist side tipping can be less on a lift truck without a load than it is on a lift truck with a load in the lowered (travel) position. Therefore, a lift truck without a load is more likely to tip sideways, especially in a turn, than a lift truck with a load carried in the lowered position.

3. For better visibility with large loads, travel with the load trailing, but always keep a proper look-out in the direction of travel. Normally, direction of travel is determined by the best visibility available to the operator. If the lift truck must travel in a direction where visibility is obstructed, a look-out helper can be required.

⚠️ WARNING

Some lift trucks have mirrors for viewing along the side to observe the tail swing area. These mirrors are an aid to the driver, but are NOT driving mirrors and must NOT be used as such when operating in reverse. Always look in the direction of travel to avoid damage to something or injury to someone.

4. When travelling up or down a grade with a heavily loaded lift truck, keep the load upgrade to maintain control.

When operating an unloaded lift truck on a steep grade, keep the counterweight upgrade.

5. Watch out for pedestrians at all times. Do not drive up to anyone standing in front of an object. Use extra care at cross-aisles, doorways and other locations where pedestrians can step into the path of travel of the lift truck. Slow down when approaching blind intersections or turns and sound the horn. The horn is to warn pedestrians that there is a vehicle in the area and to be alert to possible danger.
6. Any time the lift truck is moving keep arms, legs, etc., inside the operator's compartment. Arms and legs outside the machine can be injured when passing obstructions.

7. Avoid bumps, holes, slick spots and loose materials that may cause the lift truck to swerve or tip. If unavoidable, slow down.

Different models of lift trucks are designed to operate under different conditions. Cushion tire models are designed to operate on relatively smooth, firm surfaces. Always make sure you pick the smoothest route for your lift truck.

8. Watch clearances, especially forks, mast, overhead guard and tail swing.

A lift truck is designed to perform a wide variety of functions within limited space. The operator must be aware that the forks can sometimes extend beyond the front of the load. If the forks extend beyond the load, the operator can hit an object or lift another load. Serious accidents can be caused by mast and overhead guards hitting pipes and beams near the ceiling.
